Q&A

Open floor for questions and suggestions

Introduction, Problem Definition & Objectives

INTRODUCTION

QuickBite is a smart food ordering web platform that lets users browse food, explore categories, manage a cart and place orders online through a simple, responsive interface backed by a database.

PROBLEM

- Limited food discovery
- Difficulty comparing available items
- Less organized category browsing
- Manual order management
- No centralized digital ordering experience

OBJECTIVES

- Build a user-friendly food ordering platform
- Organize food into clear categories with search & filters
- Implement cart and wishlist functionality
- Maintain user & order data using a database
- Provide a responsive, attractive interface

USER ORDERING FLOW

Requirement Analysis & Scope

FUNCTIONAL REQUIREMENTS

- Registration & Login
- Category Browsing
- Search & Filtering
- Food Details
- Wishlist
- Shopping Cart
- Order Placement
- Order History
- Notifications
- Database Storage
- Admin food management

NON-FUNCTIONAL REQUIREMENTS

- Responsive design
- Easy navigation
- Simple user interface
- Fast interaction
- Data consistency
- Maintainable code
- Light / Dark theme support

SCOPE

A complete foundation for a web-based food ordering platform where users can discover food, manage selections and place orders.

Existing System Study

Existing food-delivery platforms commonly provide the following features:

**Restaurant & food
discovery**

Category-based browsing

Search

Cart and ordering

Offers

User accounts

Order tracking

FROM STUDY TO DESIGN

Existing Food Ordering Platforms

Study Features & User Flow

Identify Requirements

Design QuickBite

From studying existing platforms, we identified common design patterns and functional requirements adapted into a smaller academic learning project.

Proposed Solution & System Design

QuickBite provides a centralized web interface where users can:

- Register / Login
- Browse food categories
- Search and filter food
- Open food details
- Add items to wishlist
- Add items to cart
- Place orders
- View order information

TECHNOLOGIES

Frontend: HTML, CSS, JavaScript

Backend: Node.js / Express.js

Database: SQLite (project database)

Development Progress – Review 1

Current Progress: 40%

✓ COMPLETED / IMPLEMENTED

- ✓ Food category interface
- ✓ Offers & promotional sections
- ✓ User registration/login foundation
- ✓ Database structure
- ✓ Search interface
- ✓ Basic QuickBite home page
- ✓ Wishlist functionality
- ✓ Cart functionality
- ✓ Notifications
- ✓ Light / Dark theme support
- ✓ Basic order flow

→ IN PROGRESS

- Complete category-wise food pages
- Add more food items and images
- Connect food items to detail pages
- Improve filtering & category navigation
- Complete order-history / DB sync
- Remaining UI refinement

Review 1 focuses on requirement analysis, system design and initial implementation. Remaining modules will be completed in the next development phase.

Conclusion & Future Work

CONCLUSION

QuickBite provides the foundation for a web-based smart food ordering platform. In this first phase, the team completed initial requirement analysis, system planning, the database foundation and major interface components. The project is currently under active development, with category-wise food pages, detailed food views and further database integration being refined.

FUTURE WORK

- Complete all category food pages
- Add complete food images and details
- Improve filtering and search
- Complete order history synchronization
- Strengthen database integration
- Complete admin management
- Improve checkout / payment simulation
- Perform final testing and UI refinement

THANK YOU !
